

Threat Hunting With Splunk

August 16, 2017 | Cincinnati, OH

Lee Imrey | Splunk Security Specialist

splunk>workshop

Agenda

- ▶ Threat Hunting Basics
- ▶ Threat Hunting Data Sources
- ▶ Know Your Endpoint
- ▶ Cyber Kill Chain
- ▶ Walkthrough of Attack Scenario Using Core Splunk (hands on)
- ▶ Advanced Threat Hunting Techniques & Tools
- ▶ Enterprise Security Walkthrough
- ▶ Applying Machine Learning and Data Science to Security

Hands On? This Won't Work.

Am I in the right place?

Some familiarity with...

- ▶ CSIRT/SOC Operations
- ▶ General understanding of Threat Intelligence
- ▶ General understanding of DNS, Proxy, and Endpoint types of data

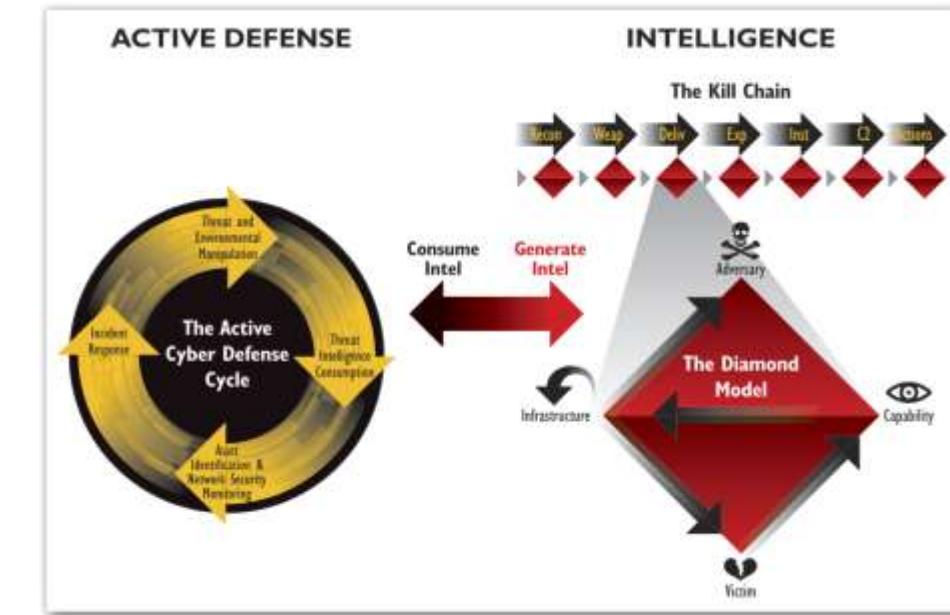

What is Threat Hunting, Why do You Need it?

What?

Threat hunting - the act of aggressively intercepting, tracking and eliminating cyber adversaries as early as possible in the Cyber Kill Chain²

Why?

Threats are human. Focused and funded adversaries will not be countered by security boxes on the network alone. Threat hunters are actively searching for threats to prevent or minimize damage [before it happens]¹

"Threat Hunting is not new, it's just evolving!"

¹ The Who, What, Where, When, Why and How of Effective Threat Hunting, SANS Feb 2016

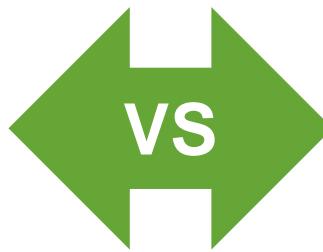

² Cyber Threat Hunting - Samuel Alonso blog, Jan 2016

A black and white portrait of a man with a beard and mustache, looking slightly to the side with a thoughtful expression.

EVERY CONTACT LEAVES A TRACE.

How Splunk Helps You Drive Threat Hunting Maturity

Hunting Tools: Internal Data

- ▶ **IP Addresses:** threat intelligence, blacklist, whitelist, reputation monitoring
Tools: Firewalls, Proxies, Splunk Stream, Bro, IDS
- ▶ **Network Artifacts and Patterns:** network flow, packet capture, active network connections, historic network connections, ports and services
Tools: Splunk Stream, Bro IDS, FPC, Netflow
- ▶ **DNS:** activity, queries and responses, zone transfer activity
Tools: Splunk Stream, Bro IDS, OpenDNS
- ▶ **Endpoint – Host Artifacts and Patterns:** users, processes, services, drivers, files, registry, hardware, memory, disk activity, file monitoring: hash values, integrity checking and alerts, creation or deletion
Tools: Windows/Linux, Carbon Black, Tanium, Tripwire, Active Directory
- ▶ **Vulnerability Management Data**
Tools: Tripwire IP360, Qualys, Nessus
- ▶ **User Behavior Analytics:** TTPs, user monitoring, time of day location, HR watchlist
Splunk UBA, (All of the above)

Typical Data Sources

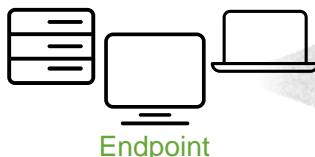

- Third-party threat intel
- Open-source blacklist
- Internal threat intelligence

Attacker, know relay/C2 sites, infected sites, IOC, attack/campaign intent and attribution

- Firewall, IDS, IPS
 - DNS
 - Email
- Web proxy
 - NetFlow
 - Network

Where they went, who talked to whom, attack transmitted, abnormal traffic, malware download

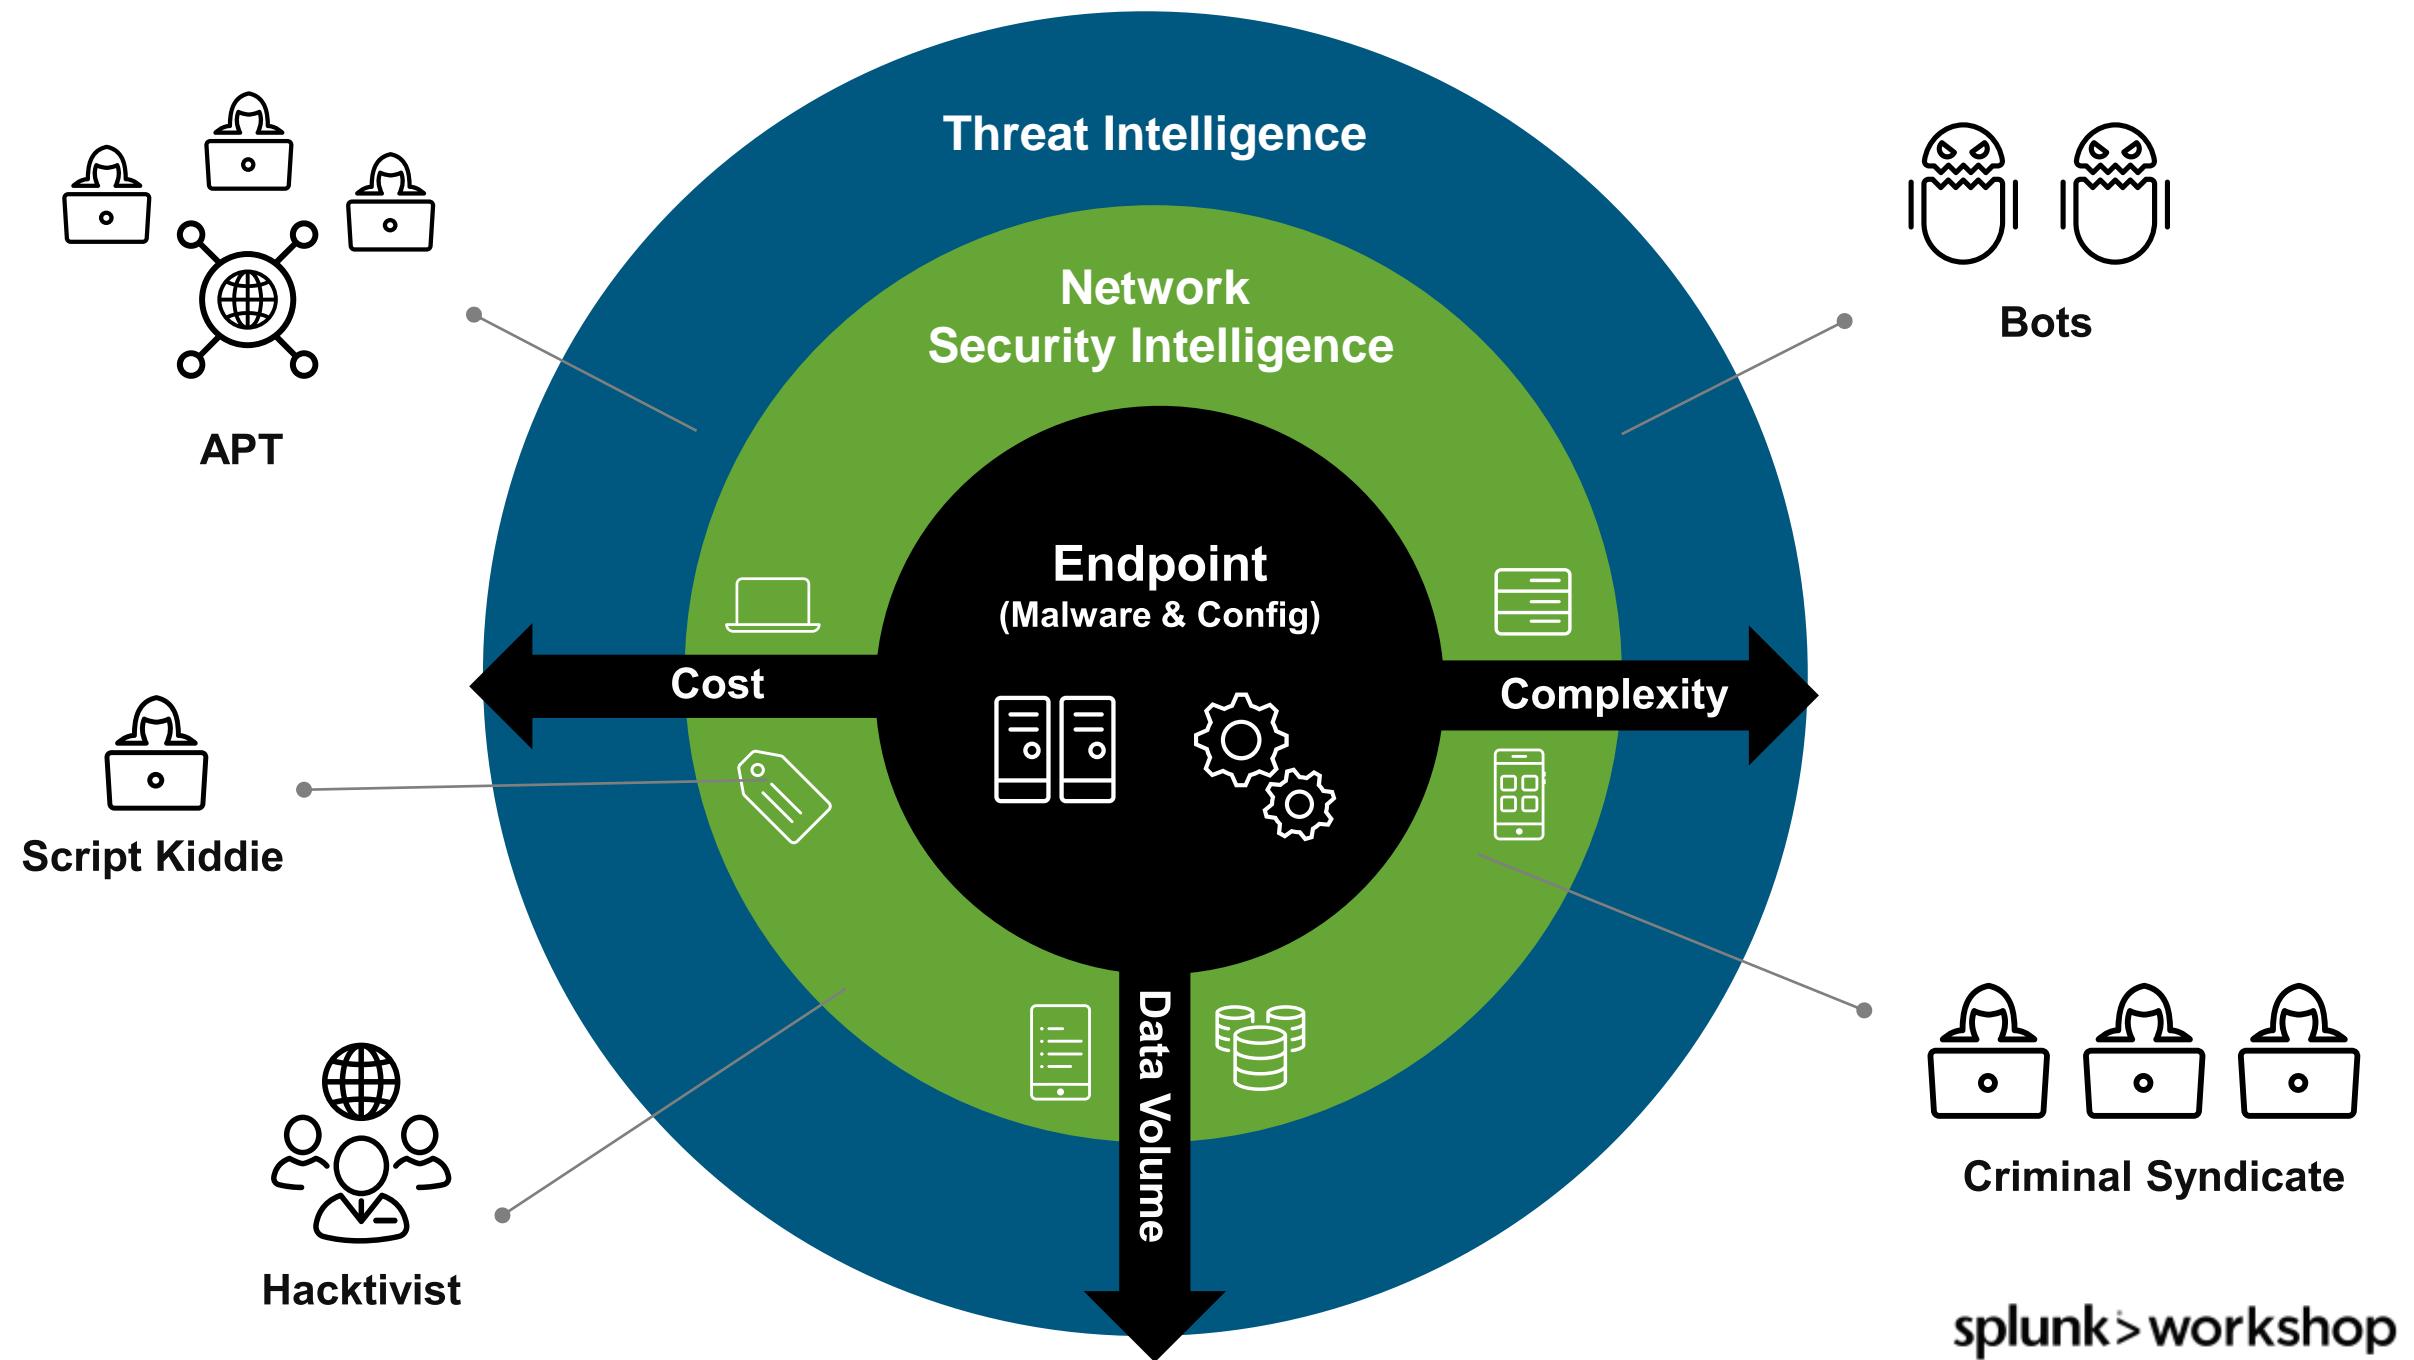

- Endpoint (AV/IPS/FW)
 - Malware detection
 - PCLM
- DHCP
 - OS logs
 - Patching

What process is running (malicious, abnormal, etc.)
Process owner, registry mods, attack/malware artifacts, patching level, attack susceptibility

- Active Directory
 - LDAP
 - CMDB
- Operating system
 - Database
 - VPN, AAA, SSO

Access level, privileged users, likelihood of infection, where they might be in kill chain

Know Your Endpoint: Microsoft Sysmon Primer

- ▶ TA Available on the App Store
 - ▶ Great blog post to get you started
 - ▶ Increases the fidelity of Microsoft Logging

Click

The initial goal of the investigation is to determine whether this communication is malicious or a potential false positive. Expand the endpoint event to continue the investigation.

Within the access to that allow investigation is important to access to the not comm

Proxy related threat intel matches are important for helping us to prioritize our efforts toward initiating an investigation. Further investigation into the endpoint is often very time consuming and often involves multiple internal hand-offs to other teams or needing to access additional systems.

This encrypted proxy traffic is concerning because of the large amount of data (~1.5MB) being transferred which is common when data is being exfiltrated.

2 5/12/14 <Event xmlns='http://schemas.microsoft.com/win/2004/08/events/event'><System><Provider Name='Microsoft-Windows-Sysmon' Guid='{5770385f-c22a-43e0-bf4c-06f5698ffbd9}'/><EventID>3</EventID><Version>3</Version><Level>4</Level><Task>1</Task><Opcode>0</Opcode><Keywords>0x8000000000000000</Keywords><TimeCreated SystemTime='2014-05-12T23:55:15.595' /><EventRecordID>350804</EventRecordID><Correlation/><Execution ProcessID='1092' ThreadID='2728' /><Channel>Microsoft-Windows-Sysmon/Operational</Channel><Computer>NSM-Server2008</Computer><Security UserID='S-1-5-18' /></System><EventData><Data Name='UtcTime'>5/12/2015 11:55 PM</Data><Data Name='ProcessGuid'>{00000000-535B-54BA-0000-001065FEA309}</Data><Data Name='ProcessId'>4768</Data><Data Name='Image'>c:\Users\cgilbert\AppData\Roaming\Irqe\svchost.exe</Data><Data Name='User'>NSM-SERVER2008\cgilbert</Data><Data Name='Protocol'>tcp</Data><Data Name='Initiated'>true</Data><Data Name='SourceIsIpv6'>false</Data><Data Name='SourceIp'>192.168.1.87</Data><Data Name='SourceHostname'>NSM-Server2008</Data><Data Name='SourcePort'>65171</Data><Data Name='SourcePortName'></Data><Data Name='DestinationIsIpv6'>false</Data><Data Name='DestinationIp'>115.29.46.99</Data><Data Name='DestinationHostname'>www.vh44850.eurodir.ru</Data><Data Name='DestinationPort'>443</Data><Data Name='DestinationPortName'>https</Data></EventData></Event>

Lets continue the inv

We immediately see the outbound communication with 115.29.46.99 via https is associated with the svchost.exe process on the windows endpoint. The process id is 4768. There is a great deal more information from the endpoint as you scroll down such as the user ID that started the process and the associated CMDB enrichment information.

Another clue. We also see that svchost.exe should be located in a Windows system directory but this is being run in the user space. Not good.

This is very concerning behavior. The malware generally creates a calc.exe dropper that will then download the Zeus malware. It seems like calc.exe may be that downloader/dropper.

This has brought us to the Process Explorer which lets us view Sysmon endpoint data.

This process calls itself "svchost.exe," a common Windows process, but the path is not the normal path for svchost.exe.

also can see that the parent process that created this

Lets continue the investigation by examining the parent process as this is a common tactic used by malware

Suspected Downloader/Dropper

...which is a common trait of malware attempting to evade detection. We also see it making a DNS query (port 53) then communicating via port 443.

vs app, but telling us that the malware has again spoofed a common file name.

The Parent Process of our suspected downloader/dropper is the legitimate PDF Reader program. This will likely turn out to be the vulnerable app that was exploited in this attack.

We have our root cause! Chris opened a weaponized .pdf file which contained the Zeus malware. It appears to have been delivered via email and we have access to our email logs as one of our important data sources. Lets copy the filename 2nd_qtr_2014_report.pdf and search a bit further to determine the scope of this compromise.

Chris opened 2nd_qtr_2014_report.pdf which was an attachment to an email!

That's not our Domain Name! The spelling is close but it's missing a "t". The attacker ...</p> <p>This looks to be a very targeted spear phishing attack as it was sent to only one employee (Chris).</p> <p>We have access to the email body and can see why this was such a convincing attack. The sender apparently had access to sensitive insider knowledge and hinted at quarterly results.</p>
			There is our attachment.

Root Cause Recap

We utilized threat intel to detect communication with known high risk indicators and kick off our investigation then worked backward through the kill chain toward a root cause.

Key to this investigative process is the ability to associate network communications with endpoint process data.

This high value and very relevant ability to work a malware related investigation through to root cause translates into a very streamlined investigative process compared to the legacy SIEM based approach.

That's an abnormally large number of requests sourced from a single IP Address in a ~90 minute window.

This looks like a scripted action given the constant high rate of requests over the below window.

Notice the Googlebot useragent string which is another attempt to avoid raising attention..

Scroll down the dashboard to examine other interesting fields to further investigate.

The requests from 52.211.114.134 are dominated by requests to the login page (wp-login.php). It's clearly not possible to attempt a login this many times in a short period of time – this is clearly a scripted brute force attack.

The attacker is also accessing admin pages which may be an attempt to establish persistence via a backdoor into the web site.

After successfully gaining access to our website, the attacker downloaded the pdf file, weaponized it with the zeus malware, then delivered it to Chris Gilbert as a phishing email.

```
.google.com/bot.html"
zeus_demo/log/access_log sourcetype = access_combined
content/uploads/2014/05/2nd_qtr_2014_report.pdf HTTP/1.1" 206

OR 1 = 1 -- ' AND password='xxx';
```

SQLI HALL-OF-SHAME

Welcome to the SQL Injection Hall-of-Shame

Shame © by Ranger78

In this day and age it's ridiculous how frequently large organizations are falling prey to SQL Injection ([SQLi](#)) which is almost totally preventable as I've [written previously](#).

Note that this is a work in progress. If I've missed something you're aware of please

let me know in the comments at the bottom of the page.

Don't let this happen to you! For some simple tips see the [OWASP SQL Injection Prevention Cheat Sheet](#). For more security info check out the [security and Defense convention: Web](#)

...and so far this year... 39

COMPANY	DATE	RESULTS	REFERENCE
GTA Fan Forum	2016-08	email addresses, passwords and other profile data for 197,000 users.	GTAGaming Hack Blamed on old Vbulletin Software
vBulletin on 11 websites	2016-08	personal information for 27 million accounts from 11 websites	Hackers exploit vBulletin flaw to access 27M accounts on 11 websites

Events Patterns Statistics (10) Visualization

20 Per Page ▾ Format ▾ Preview ▾

sourcetype ▾

- WinEventLog:Security
- XmlWinEventLog:Microsoft-Windows-Sysmon/Operational
- access_combined
- access_combined_wcookie
- bcoat_proxysg
- bro_dns
- bro_http
- cisco:esa
- email
- pan:traffic

Our learning environment consists of:

- ▶ A bunch of publically-accessible single Splunk servers
- ▶ Each with ~5.5M events, from real environments but massaged:
 - Windows Security events
 - Apache web access logs
 - Bro DNS & HTTP
 - Palo Alto traffic logs
 - Some other various bits

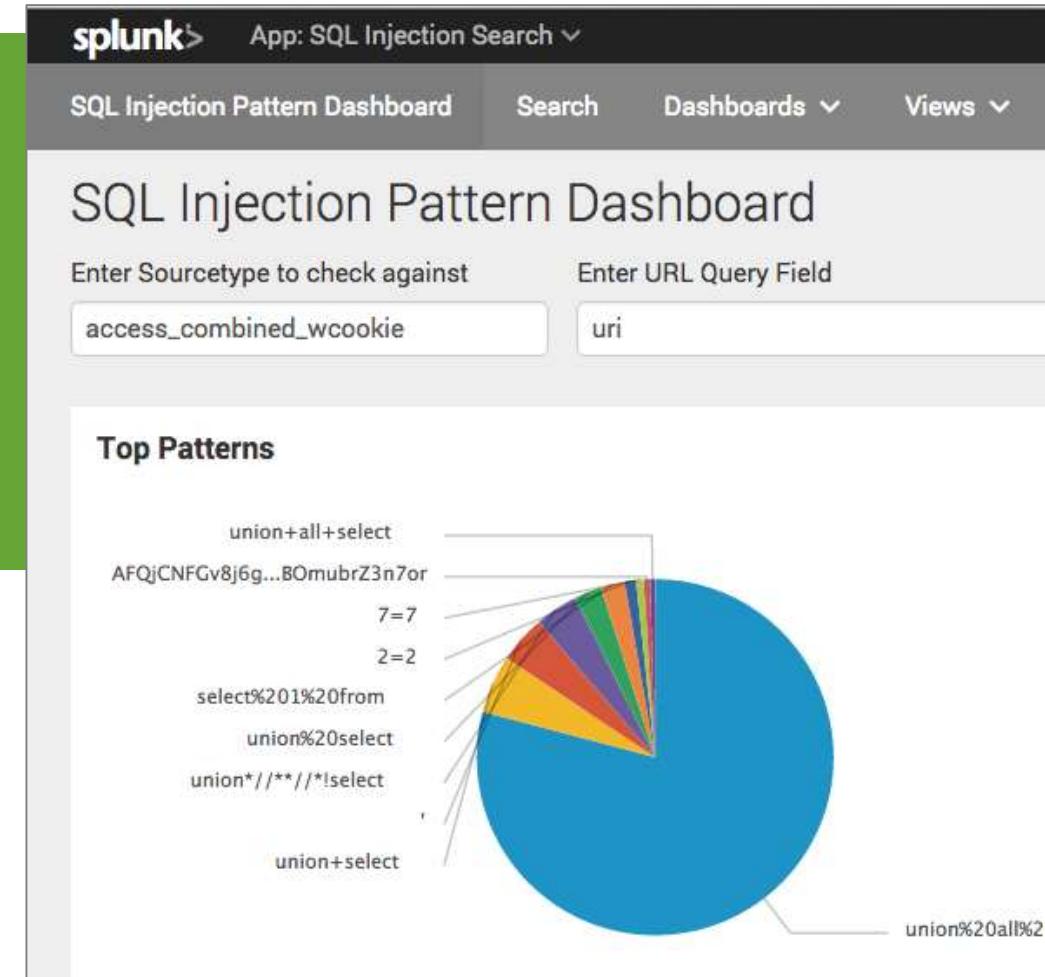

<https://splunkbase.splunk.com/app/1528/>

Search for possible SQL injection in your events:

- looks for patterns in URI query field to see if anyone has injected them with SQL statements
- use standard deviations that are 2.5 times greater than the average length of your URI query field

- ▶ Macros used
 - `sqlinjection_pattern(sourcetype, uri query field)`
 - `sqlinjection_stats(sourcetype, uri query field)`

splunk> workshop

Regular Expression FTW

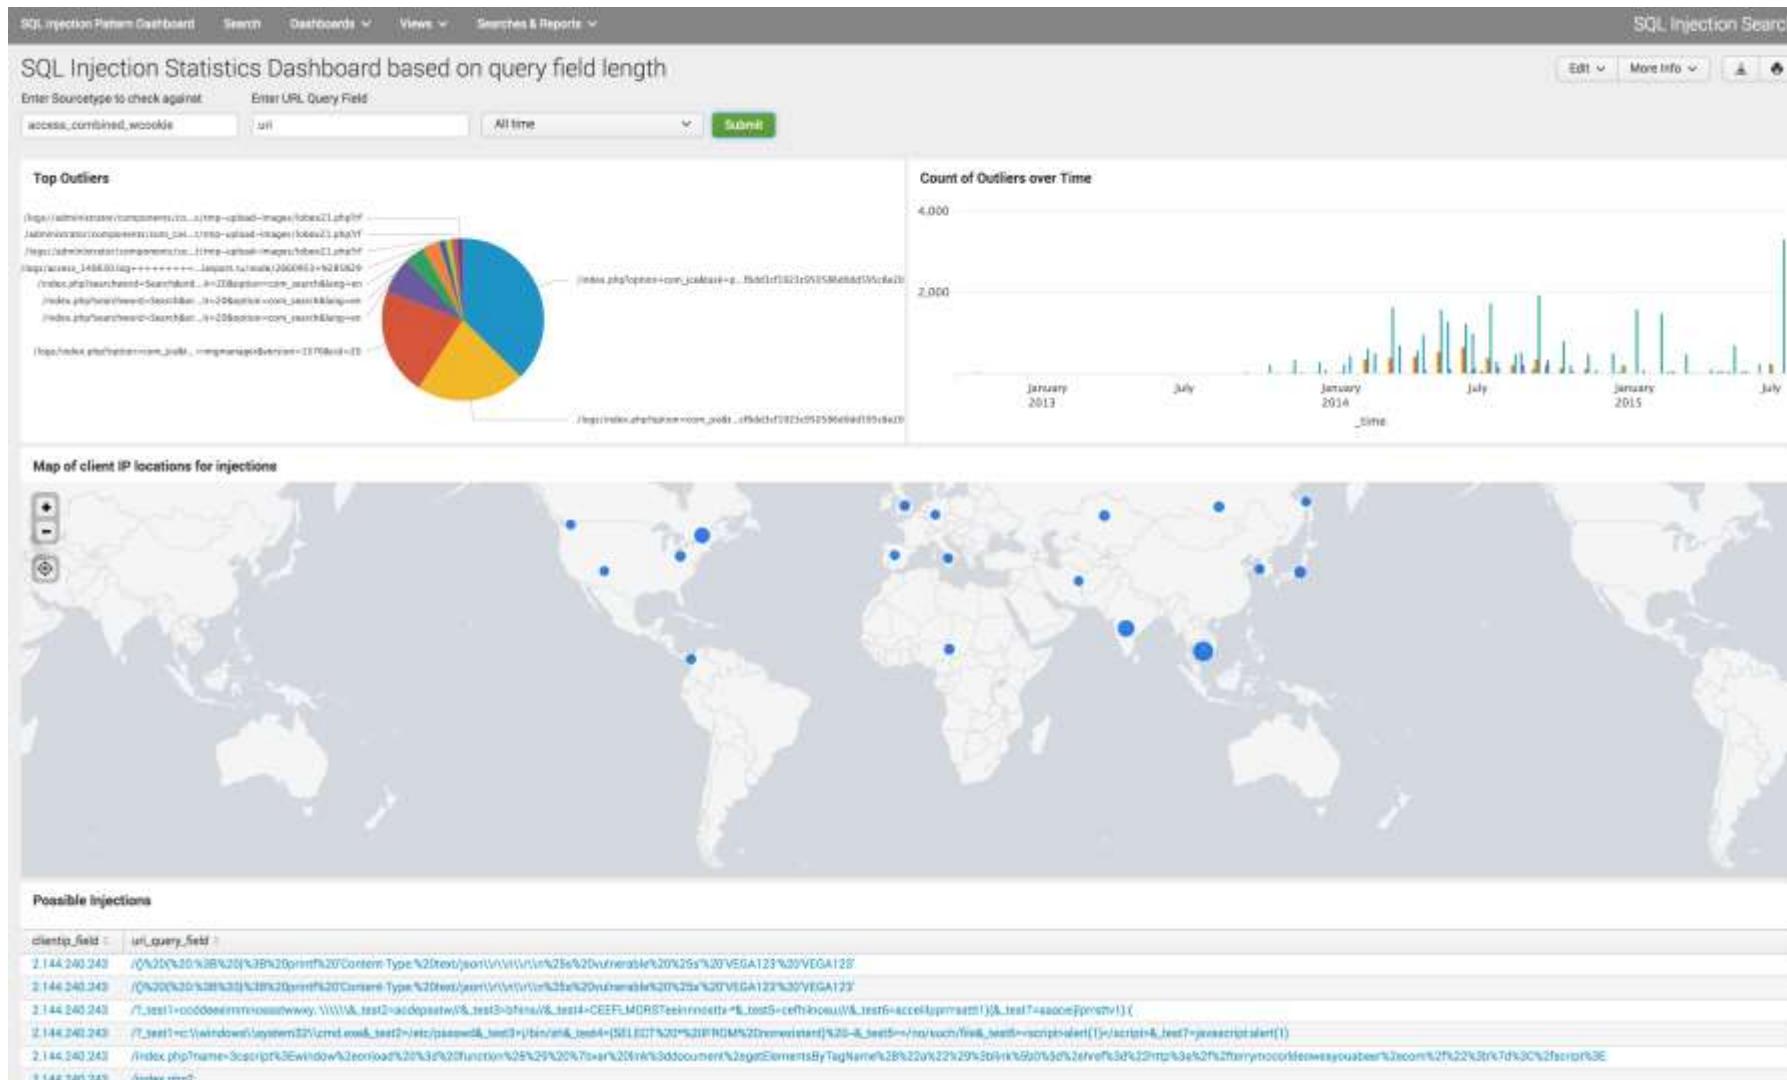

sqlinjection_rex is a *search macro*. It contains:

```
(?<injection>(?i)select.*?from|union.*?select|\$|delete.*?from|update.*?set|alter.*?table|([%27|'](%20)*=(%20)*[%27|'])|w*[%27|']or)
```

Which means: In the string we are given, look for **ANY** of the following matches and put that into the “injection” field.

- Anything containing SELECT followed by FROM
- Anything containing UNION followed by SELECT
- Anything with a ‘ at the end
- Anything containing DELETE followed by FROM
- Anything containing UPDATE followed by SET
- Anything containing ALTER followed by TABLE
- A %27 OR a ‘ and then a %20 and any amount of characters then a %20 and then a %27 OR a ‘
 - Note: %27 is encoded “” and %20 is encoded <space>
- Any amount of word characters followed by a %27 OR a ‘ and then “or”

Bonus: Try out the SQL Injection app!

splunk>workshop

Summary: Web Attacks/SQL Injection

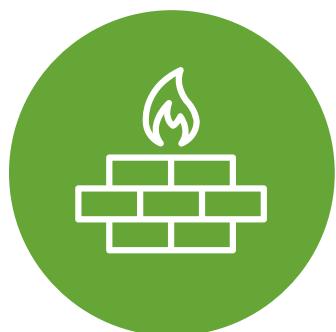

- ▶ SQL injection provide attackers with easy access to data
 - ▶ Detecting advanced SQL injection is hard – use an app!
 - ▶ Understand where SQLi is happening on your network and put a stop to it.
 - ▶ Augment your WAF with enterprise-wide Splunk searches.

DNS exfil tends to be overlooked within an ocean of DNS data.

Let's fix that!

DNS Exfiltration

- ▶ FrameworkPOS: a card-stealing program that exfiltrates data from the target's network by transmitting it as domain name system (DNS) traffic

“*But the big difference is the way how stolen data is exfiltrated: the malware used DNS requests!*”

<https://blog.gdatasoftware.com/2014/10/23942-new-frameworkpos-variant-exfiltrates-data-via-dns-requests>

“*... few organizations actually keep detailed logs or records of the DNS traffic traversing their networks — making it an ideal way to siphon data from a hacked network.*”

<http://krebsonsecurity.com/2015/05/deconstructing-the-2014-sally-beauty-breach/#more-30872>

URL Toolbox

DNS exfil detection – tricks of the trade

- ✓ parse URLs & complicated TLDs (Top Level Domain)
- ✓ calculate Shannon Entropy

List of provided lookups

- ut_parse_simple(url)
- ut_parse(url, list) or ut_parse_extended(url, list)
- ut_shannon(word)
- ut_countset(word, set)
- ut_suites(word, sets)
- ut_meaning(word)
- ut_bayesian(word)
- ut_levenshtein(word1, word2)

<https://splunkbase.splunk.com/app/2734/>

Shannon Entropy

Layman's definition: a score reflecting the randomness or measure of uncertainty of a string

► Examples

- The domain *aaaaaa.com* has a Shannon Entropy score of **1.8 (very low)**
- The domain *google.com* has a Shannon Entropy score of **2.6 (rather low)**
- *A00wlkj—(-a.aslkn-C.a.2.sk.esasdfasf1111)-890209uC.4.com* has a Shannon Entropy score of **3 (rather high)**

Detecting Data Exfiltration

► TIPS

- Leverage our Bro DNS data
 - Calculate Shannon Entropy scores
 - Calculate subdomain length
 - Display details

```
index=bro sourcetype=bro_dns
| `ut_parse(query)`
| `ut_shannon(ut_subdomain)`
| eval sublen =
length(ut_subdomain)
| table ut_domain ut_subdomain
ut shannon sublen
```

Detecting Data Exfiltration

► TIPS

- Leverage our Bro DNS data
 - Calculate Shannon Entropy scores
 - Calculate subdomain length
 - Display count, scores, lengths, deviations

```
... | stats  
count  
avg(ut_shannon) as avg_sha  
avg(sublen) as avg_sublen  
stdev(sublen) as stdev_sublen  
by ut_domain  
| search avg_sha>3  
avg_sublen>20 stdev_sublen<2
```

Detecting Data Exfiltration

▶ RESULTS

- Exfiltrating data requires many DNS requests – look for high counts
- DNS exfiltration to mooo.com and chickenkiller.com

	ut_domain	count	avg_sha	avg_sublen	stdev_sublen	subdomain_samples
1	mooo.com	15497	3.839370	34.990514	0.531142	+0aaaaaaaaanduocqspvfa==.xklsI29das +0iaaaaaaaabzuil7pzmkxa==.xklsI29das +0maaaaaaaabphjehptqkbg==.xklsI29das +0qaaaaaaaaahruabi2fmcg==.xklsI29das +0uaaaaaaaaad20fapu32nga==.xklsI29das
2	chickenkiller.com	1971	3.749215	35.000000	0.000000	+aaaaaaaaakicagzgvzyw==.xklsI29das +aiaaaaaaaabiawegzm9yia==.xklsI29das +amaaaaaaaabldyagywn0aq==.xklsI29das +aqaaaaaaaaablcirozvtyq==.xklsI29das +auaaaaaaaaagy29yzglhba==.xklsI29das
3	nerd.dk	48	3.887892	26.125000	0.732963	104.92.136.41.zz.countries 121.27.152.194.zz.countries 124.120.27.21

Summary: DNS exfiltration

- ▶ Exfiltration by DNS and ICMP is a very common technique
- ▶ Many organizations do not analyze DNS activity – do not be like them!
- ▶ No DNS logs? No Splunk Stream? Look at FW byte counts

Splunk Security Essentials

Security Essentials: Free as in Beer

splunk>workshop

Splunk Security Essentials

Identify bad guys in your environment:

- ✓ 45+ use cases common in UEBA products, all free on Splunk Enterprise
- ✓ Target external attackers and insider threat
- ✓ Scales from small to massive companies
- ✓ Save from the app, send results to ES/UBA

You can solve use cases today for free, then use Splunk UBA for advanced ML detection.

<https://splunkbase.splunk.com/app/3435/>

The screenshot shows the Splunk Security Essentials app interface. At the top, there's a navigation bar with links for Introduction, Use Cases, Assistants, Search, and Help. On the right, it says "Administrator" and "Messages". Below the navigation, there's a section titled "Use Cases" with tabs for All Examples (47 examples), Access Domain (11 examples), Data Domain (5 examples), Endpoint Domain (20 examples), Network Domain (9 examples), and Threat Domain (1 example). Under "Highlights", there are cards for "Authentication Against a New Domain Controller", "First Seen Use Case", "Detect Data Exfiltration", "First Time Accessing a Git Repository", "First Time Accessing a Git Repository Not Viewed by Peers", "First Time Login to New Server", "Healthcare Worker Opening More Patient Records Than Usual", "Increase in Pages Printed", "Anomalous New Listening Port", and "Concentration of Discovery Tools by Filename". Each card includes a brief description, an alert volume level (e.g., Medium, High, Very High), and examples of demo and live data. Below these highlights, there are more cards for "Splunk UBA Use Case", "Time Series Use Case", "Splunk ES Use Case", and "Concentration of Discovery Tools by SHA1 Hash". Each of these cards also has a "Search Use Case" button.

Recent Risk Activity

Recent Risk Modifiers					5m ago
_time	risk_object	risk_object_type	source	description	risk_score
2015-07-06 11:02:22	127.0.0.1	system	Access - Default Account Usage - Rule	Discovers use of default accounts (such as admin, administrator, etc.). Default accounts have default passwords and are therefore commonly targeted by attackers using brute force attack tools.	40
2015-07-06 11:02:18	htrapper@acmetech.com	user	Identity - Activity from Expired User Identity - Rule	Alerts when an event is discovered from a user associated with identity that is now expired (that is, the end date of the identity has been passed).	80
2015-07-06 11:02:18	dmsys	user	Identity - Activity from Expired User Identity - Rule	Alerts when an event is discovered from a user associated with identity that is now expired (that is, the end date of the identity has been passed).	80
2015-07-06 11:02:18	aseykoski@acmetech.com	user	Identity - Activity from Expired User Identity - Rule	Alerts when an event is discovered from a user associated with identity that is now expired (that is, the end date of the identity has been passed).	80
2015-07-06 11:02:18	aseykoski	user	Identity - Activity from Expired User Identity - Rule	Alerts when an event is discovered from a user associated with identity that is now expired (that is, the end date of the identity has been passed).	80
2015-07-06 11:01:49	10.11.36.12	system	Access - Excessive Failed Logins - Rule	Detects excessive number of failed login attempts (this is likely a brute force attack)	60
2015-07-06 10:54:17	PROD-POS-006	system	Audit - Anomalous Audit Trail Activity Detected - Rule	Discovers anomalous activity such as the deletion or clearing of log files. Attackers oftentimes clear the log files in order to hide their actions, therefore, this may indicate that the system has been compromised.	40
2015-07-06 10:54:06	ACME-006	system	Endpoint - High Or Critical Priority Host With Malware - Rule	Alerts when an infection is noted on a host with high or critical priority.	80
2015-07-06 10:45:09	10.11.36.47	system	Endpoint - Old Malware Infection - Rule	Alerts when a host with an old infection is discovered (likely a re-infection).	80
2015-07-06 10:45:09	10.11.36.40	system	Endpoint - Old Malware Infection - Rule	Alerts when a host with an old infection is discovered (likely a re-infection).	80

Data Science & Machine Learning In Security

Disclaimer: I am not a data scientist

BIG DATA vs DATA SCIENCE

HOARDERS

amazon

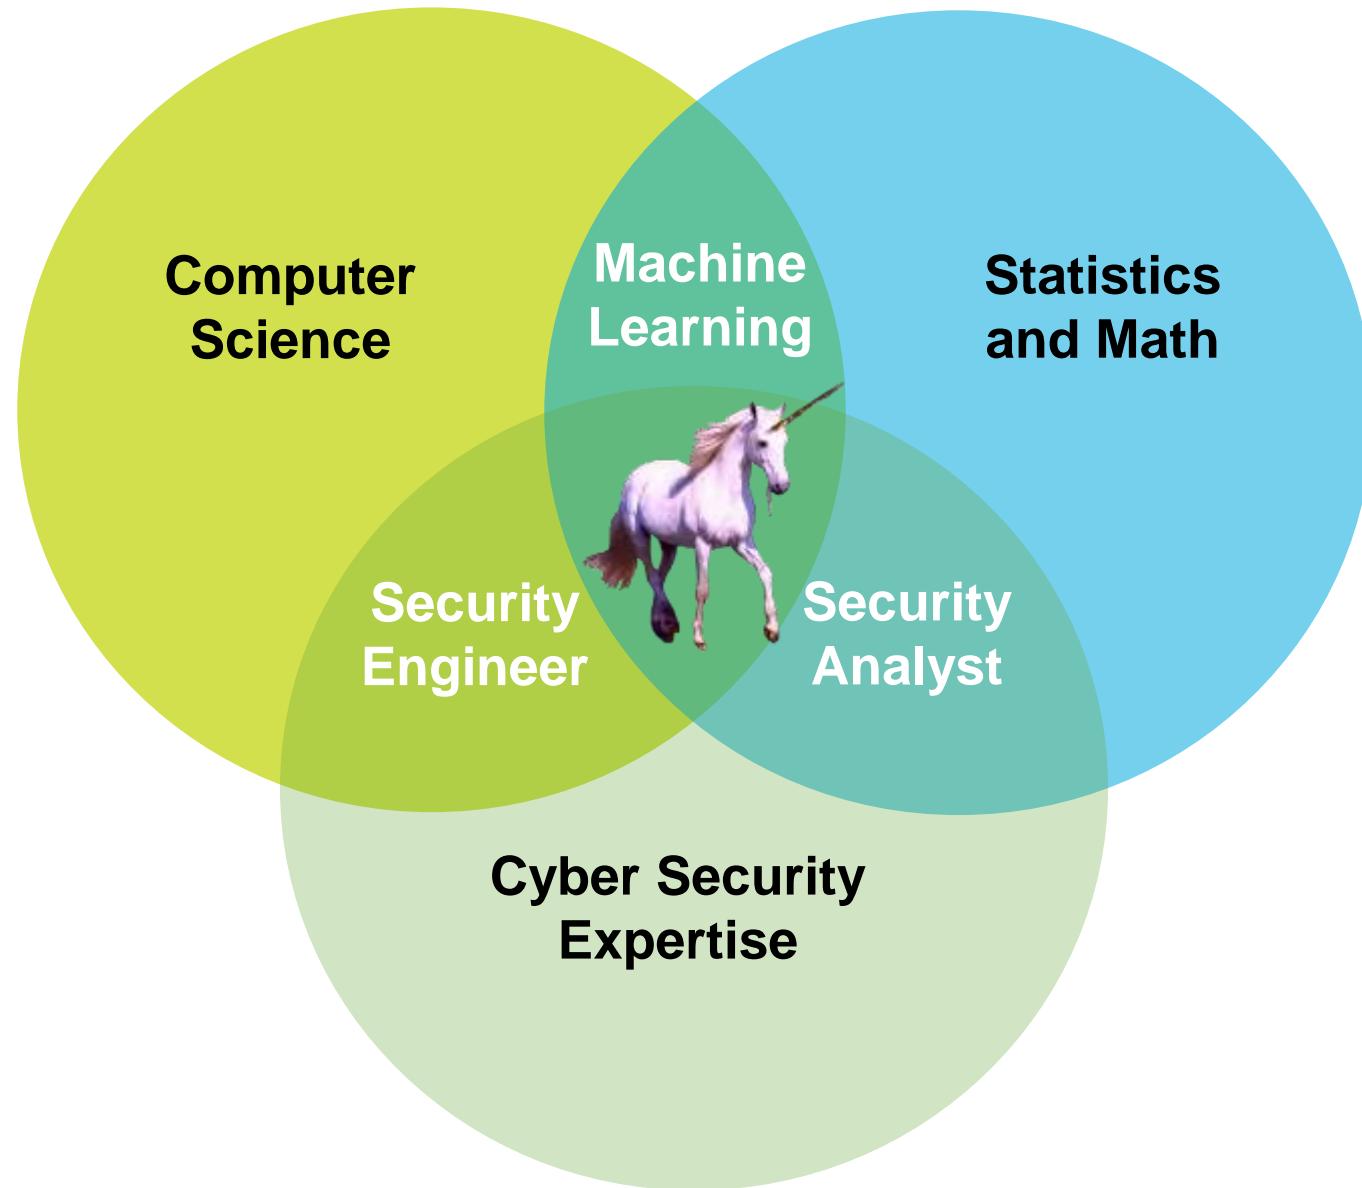

COLLECTION vs INSIGHT

Security data isn't just big data It's morbidly obese data

Security Data Science

Types of Machine Learning

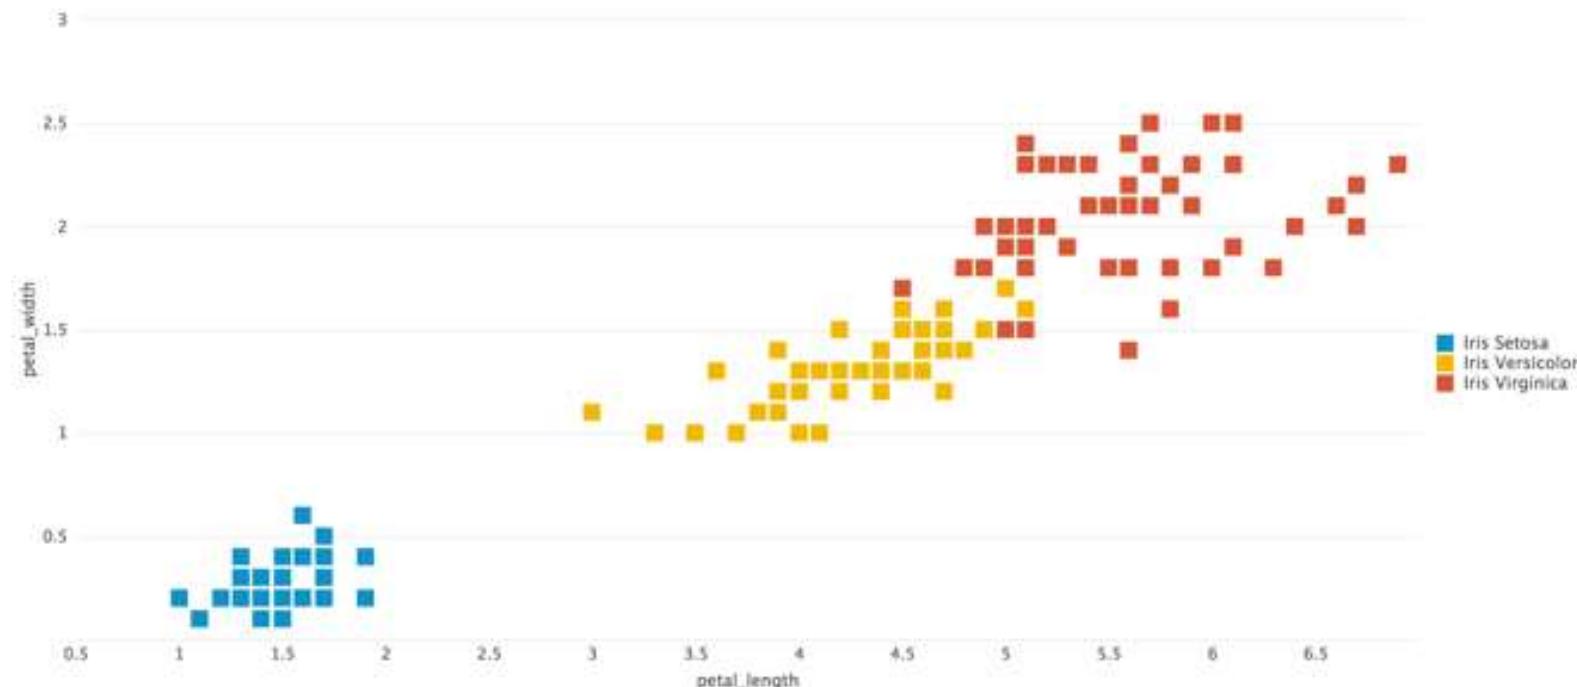

Supervised Machine Learning: Focus is to build models that make predictions based on evidence (labeled data) in the presence of uncertainty. As adaptive algorithms identify patterns in data, it "learns" from the observations.

Unsupervised Machine Learning: Used to draw inferences from datasets consisting of input data without labeled responses.

Semi-Supervised Machine Learning

Types of Machine Learning

Supervised Learning: Generalizing from labeled data

Supervised Machine Learning

- ▶ Regression: A regression problem is when the output variable is a real value, such as “authorizations over time”.
 - ▶ Classification: A classification problem is when the output variable is a category, such as “malicious” or “non-malicious.” or “authorized” and “not authorized”.
 - ▶ Anomaly Detection: Identify unusual activity, learn what normal looks like. Example: A history of normal web authorizations to then identify anything significantly different.

Supervised Machine Learning Regression

- ▶ Regression is used for predictive modeling to investigate the relationship between a dependent (target) and independent variables (predictors).
- ▶ Examples of regression algorithms:
 - Linear Regression
 - Logistic Regression
 - Stepwise Regression
 - Multivariate Adaptive Regression Splines (MARS)
 - Locally Estimated Scatterplot Smoothing (LOESS)
 - Ordinary Least Squares Regression (OLSR)

Supervised vs. Unsupervised

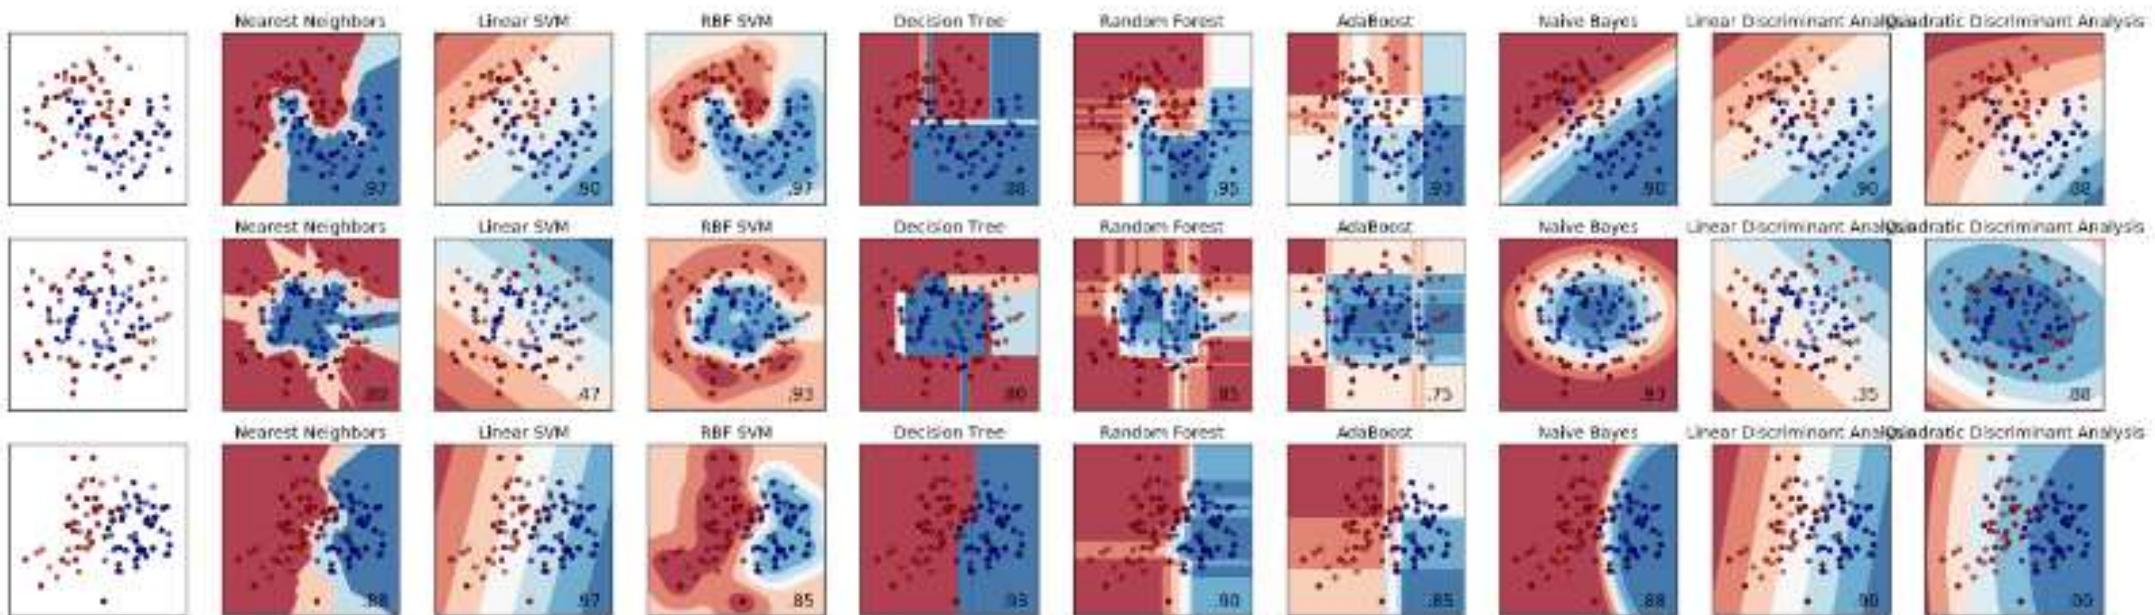

Supervised Learning

Unsupervised Learning

Sci-Kit Learn

splunk>workshop

SCI-Kit Learn

Classification

Identifying to which category an object belongs to.

Applications: Spam detection, Image recognition.

Algorithms: SVM, nearest neighbors, random forest, ...

— Examples

Regression

Predicting a continuous-valued attribute associated with an object.

Applications: Drug response, Stock prices.

Algorithms: SVR, ridge regression, Lasso, ...

— Examples

Clustering

Automatic grouping of similar objects into sets.

Applications: Customer segmentation, Grouping experiment outcomes

Algorithms: k-Means, spectral clustering, mean-shift, ...

— Examples

Dimensionality reduction

Reducing the number of random variables to consider.

Applications: Visualization, Increased efficiency

Algorithms: PCA, feature selection, non-negative matrix factorization.

— Examples

Model selection

Comparing, validating and choosing parameters and models.

Goal: Improved accuracy via parameter tuning

Modules: grid search, cross validation, metrics.

— Examples

Preprocessing

Feature extraction and normalization.

Application: Transforming input data such as text for use with machine learning algorithms.

Modules: preprocessing, feature extraction.

— Examples

ML Toolkit & Showcase

- ▶ Splunk Supported framework for building ML Apps
 - Get it for free: <http://tiny.cc/splunkmlapp>
 - ▶ Leverages **Python for Scientific Computing** (PSC) add-on:
 - Open-source Python data science ecosystem
 - NumPy, SciPy, scikit-learn, pandas, statsmodels
 - ▶ **Showcase use cases:** Predict Hard Drive Failure, Server Power Consumption, Application Usage, Customer Churn & more
 - ▶ **Standard algorithms** out of the box:
 - Supervised: **Logistic Regression, SVM, Linear Regression, Random Forest, etc.**
 - Unsupervised: **KMeans, DBSCAN, Spectral Clustering, PCA, KernelPCA, etc.**
 - ▶ Implement one of 300+ algorithms by editing Python scripts

ML Toolkit and Showcase

Implement one or more algorithms by editing Python scripts

Machine Learning Toolkit Demo

Splunk for Analytics and Data Science

This course, delivered over three virtual days, covers implementing analytics and data science projects using Splunk's statistics, machine learning, built-in and custom visualization capabilities.

[View schedule »](#)

[Download course description »](#)

Upcoming Classes

Course Topics

- Analytics Framework
- Exploratory Data Analysis
- Machine Learning
- Market Segmentation
- Transactional Analysis
- Anomaly Detection
- Estimation and Prediction
- Classification
- Data Visualization

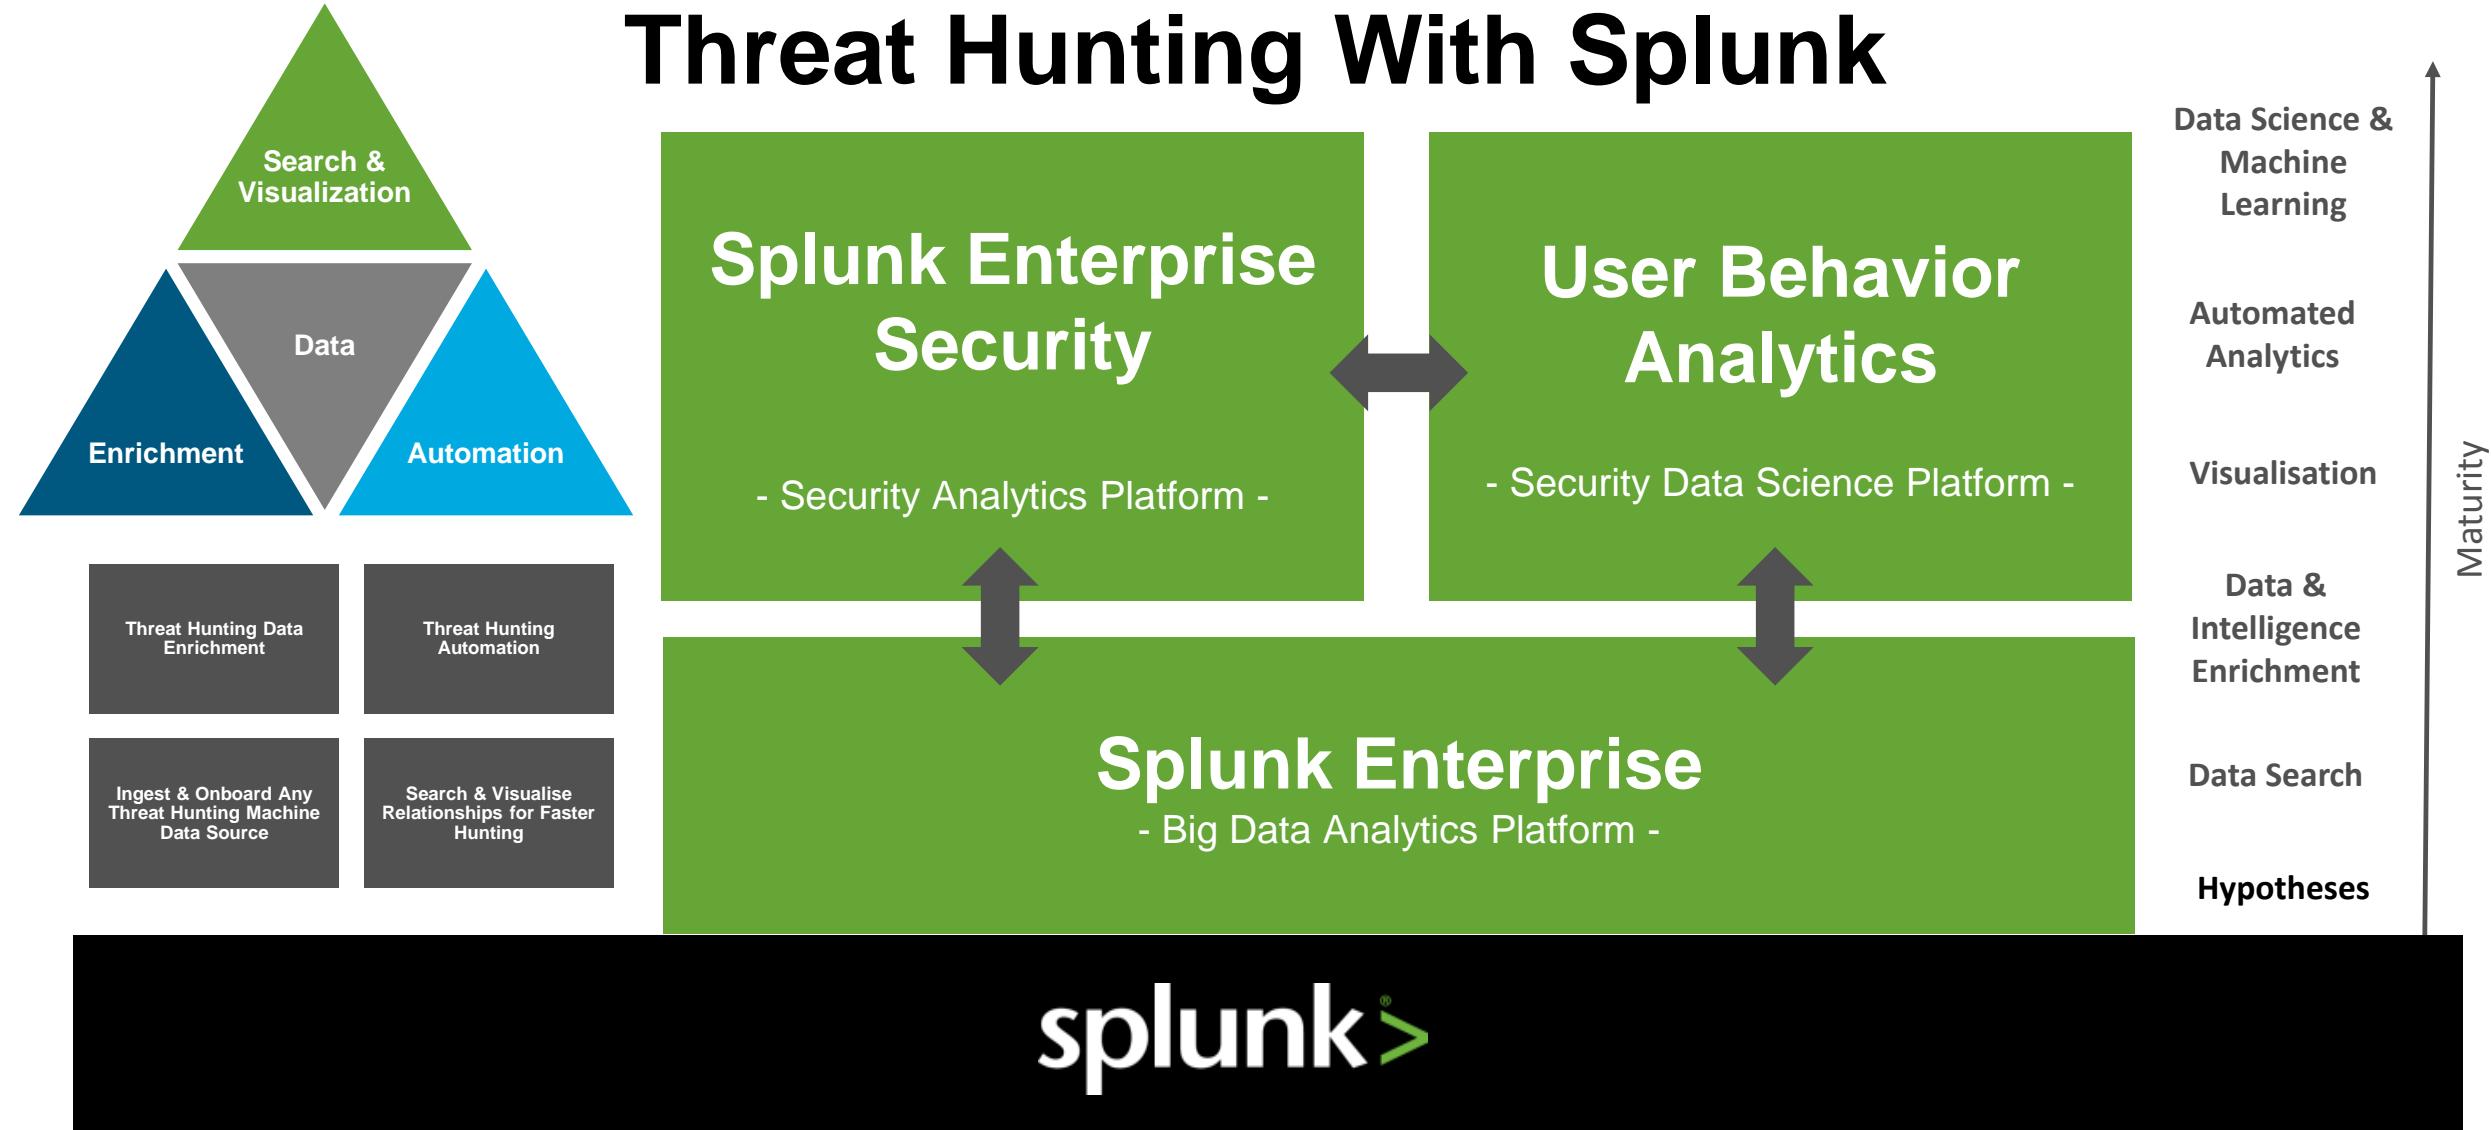

Course Prerequisites

- Using Splunk
- Searching and Reporting with Splunk
- Creating Splunk Knowledge Objects
- Advanced Searching and Reporting with Splunk
- OR equivalent Splunk experience

Splunk UBA

splunk>workshop

Machine Learning Security Use Cases

Machine Learning Use Cases

User & Entity Behavior Baseline

Behavioral Peer Group Analysis

Insider Threat Detection

IP Reputation Analysis

Reconnaissance, Botnet and C&C Analysis

Statistical Analysis

Data Exfiltration Models

Lateral Movement Analysis

Polymorphic Attack Analysis

Cyber Attack / External Threat Detection

Entropy/Rare Event Detection

User/Device Dynamic Fingerprinting

Splunk UBA Use Cases

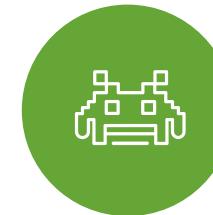

Insider Treats

- ▶ **Account Takeover**
 - Privileged account compromise
 - Data exfiltration
 - ▶ **Lateral Movement**
 - Pass-the-hash kill chain
 - Privilege escalation
 - ▶ **Suspicious Activity**
 - Misuse of credentials
 - Geo-location anomalies

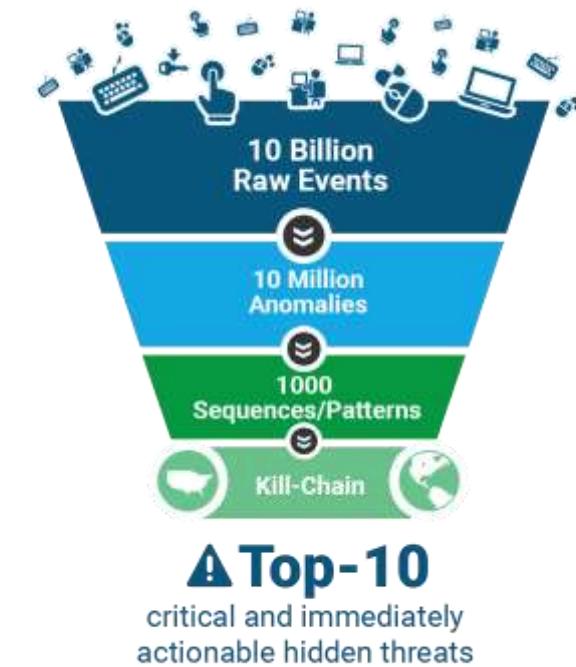

External Threats

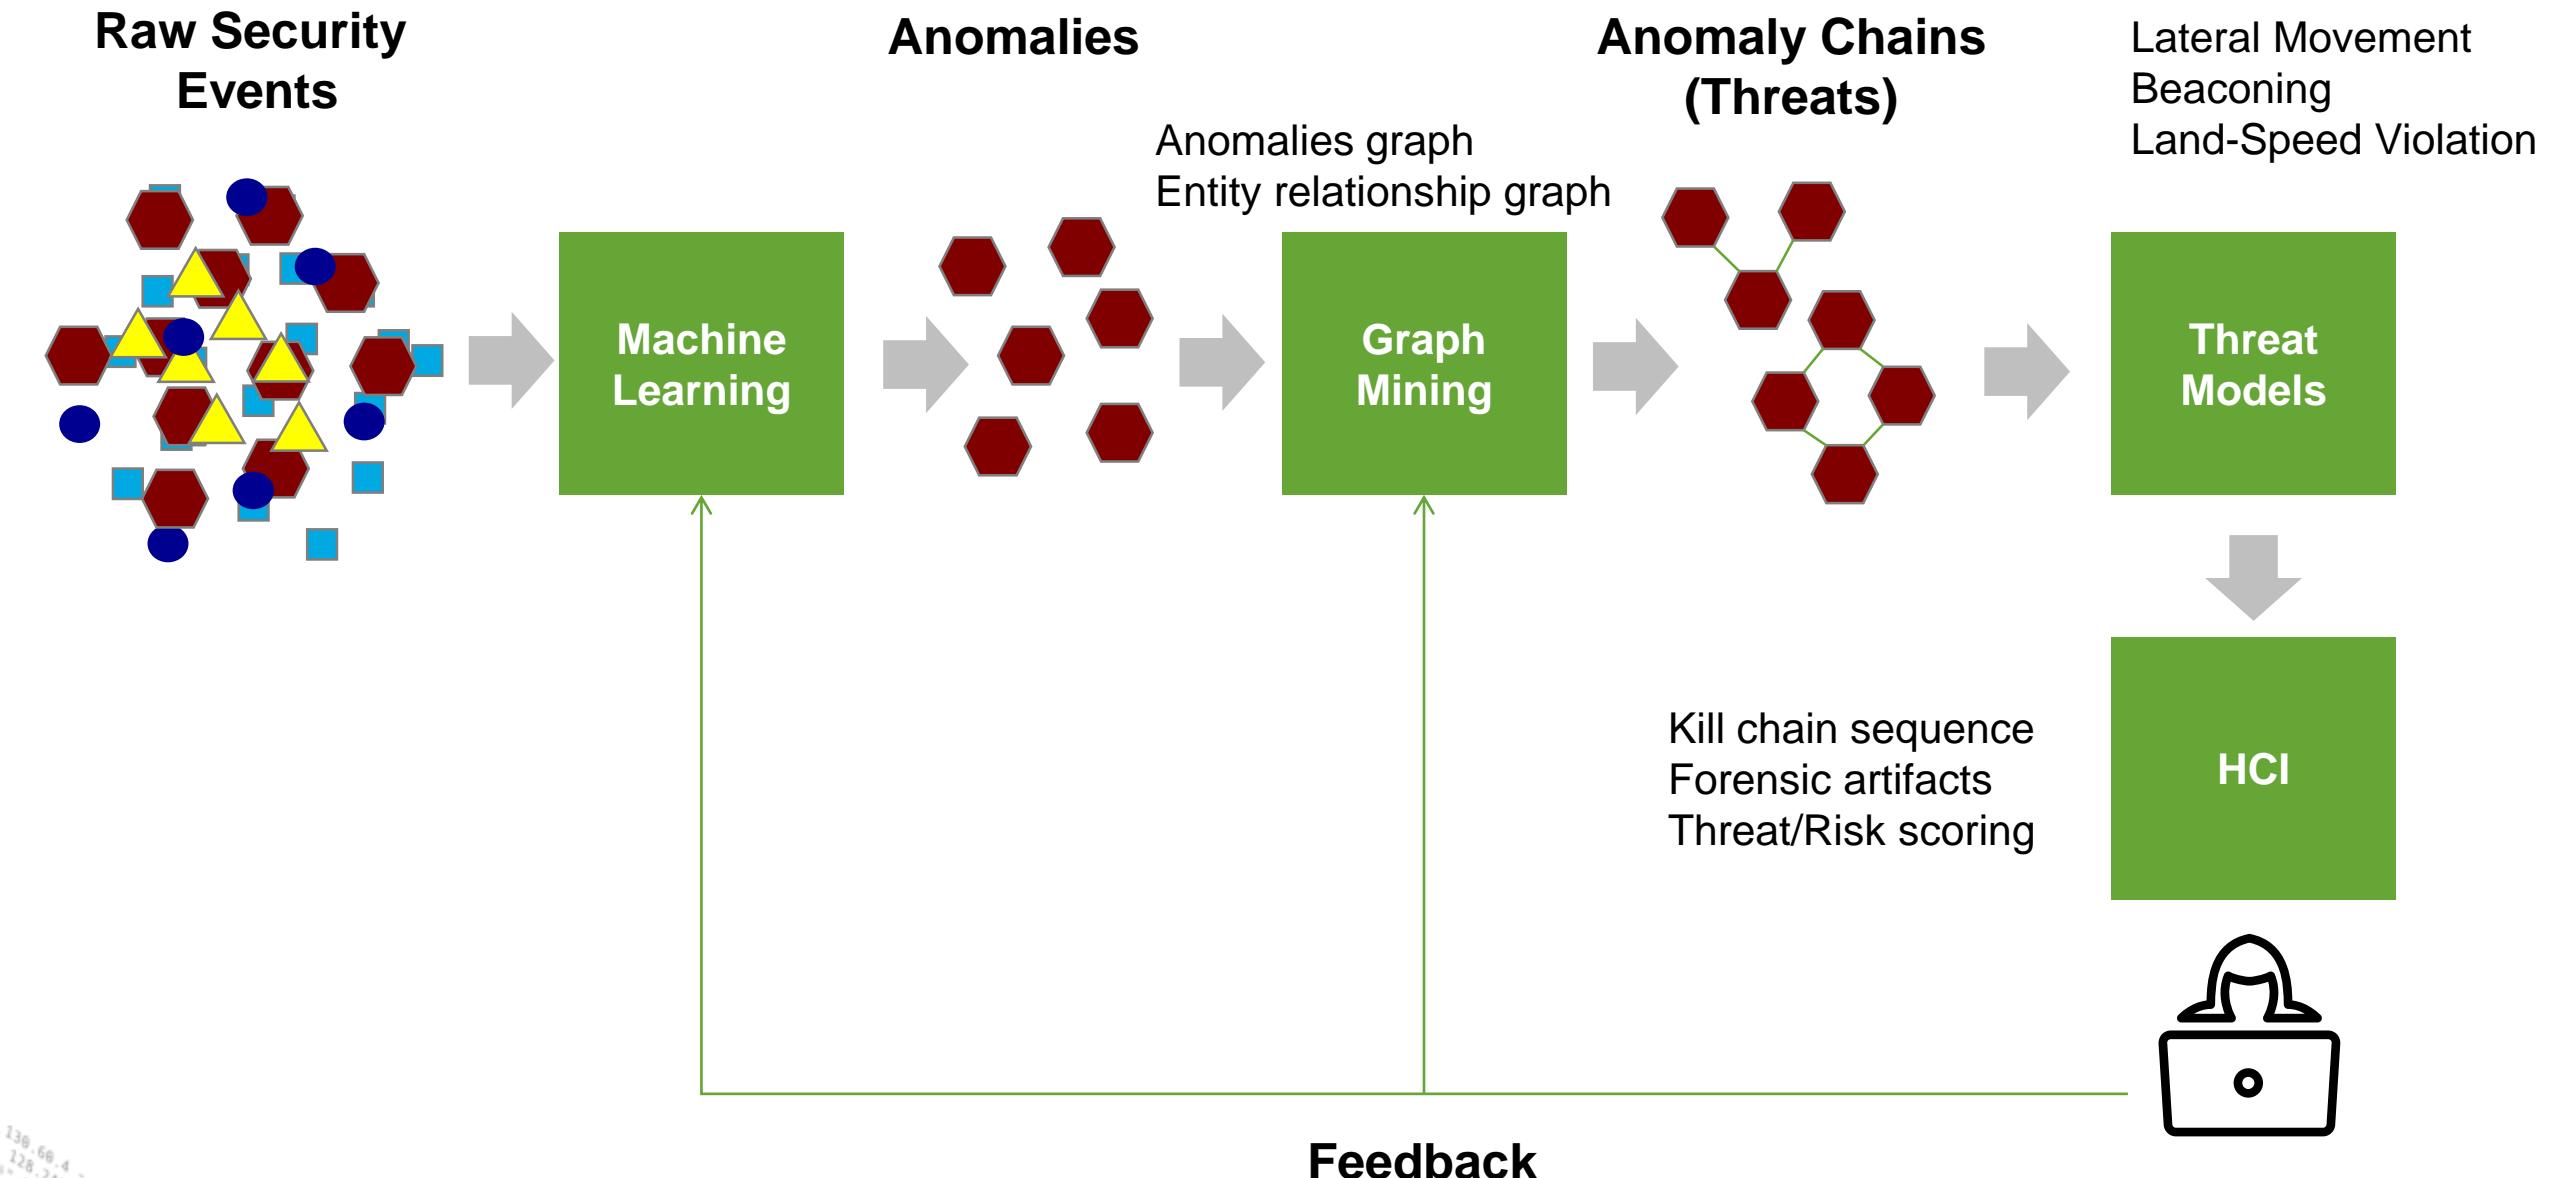

- ▶ **Malware Attacks**
 - Hidden malware activity
 - ▶ **Botnet, Command & Control**
 - Malware beaconing
 - Data leakage
 - ▶ **User & Entity Behavior Analytics**
 - Suspicious behavior by accounts or devices

Splunk User Behavior Analytics (UBA)

- ▶ ~100% of breaches involve valid credentials (Mandiant Report)
- ▶ Need to understand normal & anomalous behaviors for ALL users
- ▶ UBA detects Advanced Cyberattacks and Malicious Insider Threats
- ▶ Lots of ML under the hood:
 - Behavior Baselining & Modeling
 - Anomaly Detection (30+ models)
 - Advanced Threat Detection
- ▶ E.g., Data Exfil Threat:
 - “Saw this strange login & data transferfor user kwestin at 3am in China...”
 - Surface threat to SOC Analysts
